

Synapse Layer

“Giving Agents a Past. Giving Models a Soul.”

Persistent zero-knowledge memory for AI agents. Store, recall and transfer encrypted context across models via MCP.

The server NEVER sees your data — AES-256-GCM client-side encryption with PBKDF2 key derivation.

Commands

synapse remember

Store a memory with zero-knowledge AES-256-GCM encryption.

```
synapse remember --user <uuid> --text "User prefers dark mode" --category preference --importance 0.9
```

synapse recall

Semantic recall via pgvector HNSW cosine similarity (384-dim gte-small).

```
synapse recall --user <uuid> --query "What are user preferences?" --limit 5
```

synapse handover

Neural Handover™ — transfer full context between AI models with HMAC-SHA256 signing.

```
synapse handover --user <uuid> --from claude-sonnet-4 --to gpt-4o
```

synapse resolve

Consensus Engine™ — detect & auto-resolve conflicting memories via Trust Quotient.

```
synapse resolve --user <uuid>
```

TQ Formula: `importance(35%) + confidence(25%) + stability(20%) + credit(10%) + recency(10%)`

synapse list

List active encrypted memories ordered by importance.

```
synapse list --user <uuid> --limit 20
```

synapse forget

Soft-delete a memory (LGPD/GDPR compliant — encrypted data retained for audit).

```
synapse forget --user <uuid> --memory <memory-id>
```

Installation

```
# Global install
npm install -g synapse-layer

# Or use directly with npx
npx synapse-layer <command>
```

Demo Scripts

Demo A: Neural Handover™

Seamless context transfer: Claude → GPT-4o → Gemini

```
./examples/demo-a-neural-handover.sh
```

Demo B: Conflict Resolution™

Consensus Engine™ detecting and resolving conflicting memories

```
./examples/demo-b-conflict-resolution.sh
```

MCP Server

```
https://rbeycxzizrrdmpilepc.supabase.co/functions/v1/mcp-server
```
